## **Summary**

Lowering human population densities and our unsustainable consumptive processes are necessary for positively ethical applied ecology. In particular we need to target the poor with appropriate resources and socio-political/spiritual support. Sustainable Livelihoods, Holistic Resource Management, Natural Systems Agriculture, and Conservation and Development of Sustainable Community seem to be front-running approaches toward achieving sustainable Local Development in a positively ethical and ecologically-sound manner.

## **Key Words**

Conservation, Sustainable, Community

## **Introduction**

A positively ethical applied ecology approach to quality life for as many genetically diverse species as possible for as long as possible, involves the appropriate integration and balance of social, political and economic sectors at the local and global level. Basic ecological principles guide effective and ethical social values that target the poor with equitable resources and sustainable livelihood policies that move us toward efficient participation by all (individuals) of species, and ecological economic models that include measurement and evaluation of ecological footprints/carrying capacity, energetics, material flow (in, through, and out) of
